

MODULE 05

Test Automation with Tosca

Day 2 · Optional MVP Module

Test Automation with Tosca

Scan App

Model

Execution List

Quality Gate

LEARNING OBJECTIVES

- Understand model-based testing for API and UI validation.
- Organize execution lists and quality gates.
- Publish automated test results into delivery workflows.

WHY THIS MODULE MATTERS

This module can be delivered as an optional hands-on track once Tosca provisioning is complete.

Otherwise it runs as an instructor-led demo in MVP phase one.

Optional Module

Instructor demo if licensing isn't ready

Instructor Demo

or

Hands-On Lab

CONCEPT MAP

How a Tosca model-based test run actually moves from the app to a pipeline gate.

FROM THE DOCS: WHAT MODEL-BASED TESTING ACTUALLY MEANS

- Tosca scans an app's UI/API to build a codeless, business-readable automation model — not hand-written scripts.
- Tricentis's own framing: traditional scripted tools are technical and brittle; MBT decouples test logic from the model.
- Modules capture reusable app objects; updating one Module auto-syncs the change across every linked TestCase.
- TestCases are assembled from TestSteps (actions) and TestStepValues (data/verification points).
- Tosca Cloud connects to CI/CD tools like Jenkins via API to automate execution end to end.

COURSEWARE FOCUS

- Model-based testing
- Execution lists
- CI integration

TOOLS & RESOURCES

Official Docs

Tricentis Tosca Documentation: Model-Based Testing and ADO Integration

Theoretical basis for MBT (Modules, TestCase Design, Execution Lists).

CI/CD Plugin

Tricentis Tosca Execution Task for Azure DevOps / GitHub Actions

Integrating automated UI/API test runs directly into pipelines.

Target App

Modernized REST API built in Module 4

Live endpoint target for scanning UI and executing API test suites.

SUPPORTING ASSETS

- Target app from Module 4
- Tosca runtime and integration connectors

LAB 05: TEST AUTOMATION QUALITY GATES

Lab 05: Test Automation Quality Gates

Execution List

Quality Gate

LAB STEPS

Goal: Build and run automation suites and define release quality gates.

Tools: Tosca (installed and licensed) · Target app is the Lab 04 API.

- Step 1 — Scan the target UI and API endpoints.
- Step 2 — Build smoke and regression suites.
- Step 3 — Execute test lists and capture results.
- Step 4 — Publish results to the pipeline or work tracking.
- Step 5 — Define pass/fail quality gate thresholds.
- Validation: the automated suite executes successfully, and gate criteria are documented.

KNOWLEDGE CHECK: Test Automation with Tosca

What does model-based testing primarily rely on to design test cases?

- A. Random fuzzing of inputs
- B. A model or representation of the application, rather than hand-scripted steps
- C. Manual exploratory testing only
- D. Production incident reports

A Codeless Model

Not Hand-Written Scripts

KNOWLEDGE CHECK: Test Automation with Tosca

What does model-based testing primarily rely on to design test cases?

- A. Random fuzzing of inputs
- B. A model or representation of the application, rather than hand-scripted steps**
- C. Manual exploratory testing only
- D. Production incident reports

A Codeless Model

Not Hand-Written Scripts

KNOWLEDGE CHECK: Test Automation with Tosca

In Tosca's model, what happens when you update one Module used across many TestCases?

- A. Nothing — each TestCase must be edited by hand
- B. The change automatically syncs to every linked TestCase
- C. All TestCases using it are deleted
- D. Only the newest TestCase updates
